Challenge 22 - Laravel

For this challenge you need to make a new Laravel project.

The project consists of 3 main pages:
- Home page
- Page for entering name, surname and email
- Information page

.

Once you enter your first name, last name and email, the values should be stored in session.

Before storing them in session, the following things should be validated:
- Name: required, must consist of only letters and cannot contain more than 15 characters.
- Surname: required, must consist of only letters and cannot contain more than 25 characters.
- Email: not required, but if entered it must be a valid email.

If the validation passes, you should redirect the user to the page where the data will be displayed.

A button should appear on the other two pages, which when clicked, the values entered in the session will be removed.

If the validation has not passed, the errors should be displayed above each input, and the values in the inputs should not be lost.

If a user fills the form, when they return to the homepage, their first and last name should be displayed instead of "YOU" (see pictures).

Do not use Auth;

Scoring :

1 point A complete design of the front-end.

3 points A complete functionality of storing the information in session, displaying it and clearing the session on the button.

5 points Validation for the inputs, displaying the errors and retaining the values in the inputs in case of an error.

Deadline:

One week after its presentation, 23:59h end of the day.
